Joint NASA-ESA LISA Study Team Meetings - August 27-29 2018

CAN LISA HEAR THIS? A LISA OBSERVER TOOL

LISA DATA CHALLENGE

Waveform codes

Noise model

User inputs:

- GW source type
- Binary object masses
- Frequency or orbital separation
- Luminosity distance or redshift
- Sky location or favorable/unfavorable configuration

CLHT

Tool outputs:

- SNR value
- Signal amplitude + noise sensitivity vs freq.
- SNR vs time plot
- Estimates of parameter precisions (in progress)

▶ **Particularities of CLHT:**

- Directly works in TDI domain (this is what we will measure): plots GW amplitude spectrum and integrated noise level
- No sky-averaged answers: possibility to give outputs for chosen sky location, or favorable/unfavorable configurations (intervals)

▶ **Needs for discussion:**

- Tradeoff between accuracy and complexity. Example: for merging objects, strong dependence on the initial orbital phase of the constellation
- Format of inputs/outputs

▶ **To be implemented:**

- Estimates of parameter uncertainties
- Interactive plotting

▶ **Coming soon:**

- Public URL
- EMRI sources

EXAMPLE FOR A GALACTIC BINARY

LISA Observer Tool

Type of Source: 3 choices

- Non-merging binary (quasi-monochromatic)
- Merging binary
- Extreme-mass ratio inspiral

Source Parameters: 6 values to specify

Intrinsic Mass of Object 1 (M_{\odot})

Intrinsic Mass of Object 2 (M_{\odot})

Source Inclination angle (deg)

Wave polarization angle (deg)

Luminosity Distance (mpc) or Redshift

Orbital Period (sec) or Separation Distance (km)

Sky Location and Orientation

User Specified
Latitude Longitude

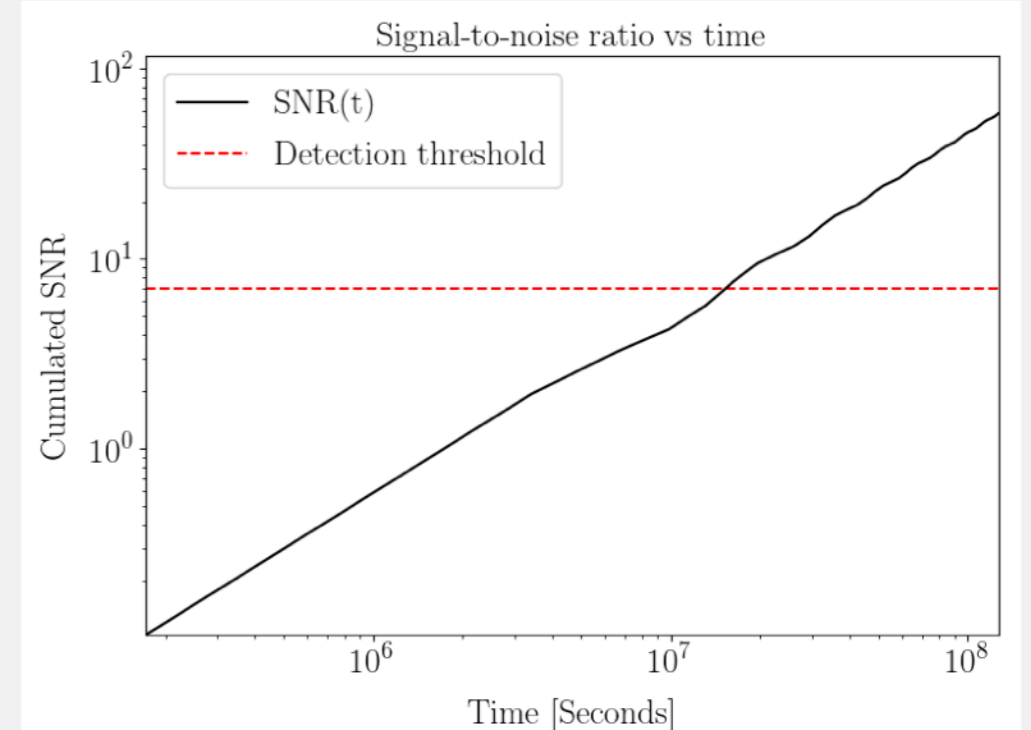

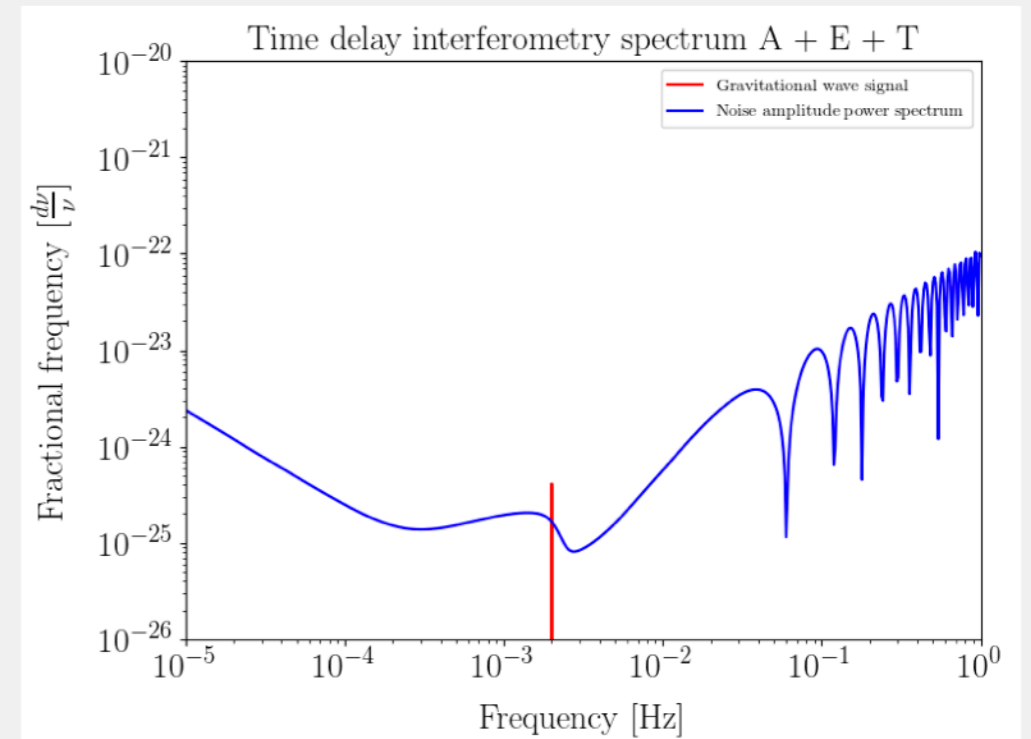

Favorable

Unfavorable
